Jon Kleinberg and Éva Tardos: Algorithm Design

Lec. #	Date	Topics
1	10/4	Introduction, Stable matching
2	10/11	Basics of Algorithm Analysis, Greedy Algorithms (1/2)
3	10/18	Greedy Algorithms (2/2)
4	10/25	Divide and Conquer (1/2)
5	11/1	Divide and Conquer (2/2)
6	11/8	Dynamic Programming (1/2)
7	11/15	Dynamic Programming (2/2)
—	11/22	Thursday Classes
8	11/29	Network Flow (1/2)
9	12/6	Network Flow (2/2)
10	12/13	NP and Computational Intractability
11	12/20	Approximation Algorithms (1/2)
12	12/27	Approximation Algorithms (2/2)
13	1/10	Randomized Algorithms

What is an algorithm?

- a set of rules to solve a particular problem
- stems from **al-Khwarizmi**
 - c. 780– c. 850
 - a Persian mathematician, astronomer, and geographer
 - In the 12th century, Latin translations of his work on the Indian numerals introduced the decimal number system to the Western world

Outline

- 1 Introduction
- 2 Stable Matching

- n men and n women
- each man (woman) ranks all the woman (man)
- goal: to find a “stable” matching

Blocking Pair

a matching is unstable if **blocking pairs** (pairs like the following) exist

Stable matching

a matching without blocking pairs is a **stable matching**

stable

unstable

Question

- Does a stable matching always exist?
- Efficiently computable?

Stable matching

a matching without blocking pairs is a **stable matching**

stable

unstable

Question

- Does a stable matching always exist?
- Efficiently computable?

➡ **YES! By the Gale–Shapley algorithm!** [Gale and Shapley 1962]

Gale–Shapley Algorithm

```
1 Initially all  $m \in M$  and  $w \in W$  are single, and  $S \leftarrow \emptyset$ ;  
2 while  $\exists m \in M$  who is single do  
3    $w \leftarrow$  the most-preferred woman for  $m$  to whom he has not proposed;  
4    $m$  proposes  $w$ ;  
5   if  $w$  is single then  
6      $w$  accepts  $m$  ( $S \leftarrow S \cup \{(m, w)\}$ );  
7   else if  $w$  matches with  $m'$  and  $m \succ_w m'$  then  
8      $w$  rejects  $m'$  and accepts  $m$  ( $S \leftarrow S \setminus \{(m', w)\} \cup \{(m, w)\}$ );  
9   else  
10     $w$  rejects  $m$ ;  
11 Return  $S$ ;
```

Analysis of the GS algorithm (1/2)

Theorem

The GS algorithm terminates in at most n^2 steps

Proof

- Each $m \in M$ proposes to each w at most once
- # of proposals $\leq |M| \times |W| = n^2$

Analysis of the GS algorithm (2/2)

Theorem

The GS algorithm always outputs a stable matching

Proof

- Suppose to the contrary that (m, w) is a blocking pair
- Then m must propose to w in the procedure
- w 's final partner must be someone more preferable than m
→ contradiction

Applications of the GS algorithm

The GS algorithm (and its extension) is used in real world

- Resident matching (US, UK, Japan,...)

- School choice (New York, Boston,...)
- Laboratory assignments at various universities
- UTokyo 進学選択の第二段階

<http://www.c.u-tokyo.ac.jp/zenki/news/kyoumu/firstyear/2016/1125173747.html>

Multiple stable matchings

- there may be multiple stable matchings
- any “good” structure?

Operations

For stable matchings S_1 and S_2 ,

- $S_1 \vee S_2$: matching s.t. each man selects better partner in $S_1 \cup S_2$
each woman selects worse partner in $S_1 \cup S_2$
- $S_1 \wedge S_2$: matching s.t. each man selects worse partner in $S_1 \cup S_2$
each woman selects better partner in $S_1 \cup S_2$

$S_1 \triangle S_2$

Structure of stable matchings

Theorem

$S_1 \vee S_2$ and $S_1 \wedge S_2$ are stable matchings

- the stable matchings form a (distributive) **lattice**
- \exists man-optimal stable matching and woman-optimal stable matching

Proof

Output of the GS algorithm

Theorem

The GS algorithm outputs the man-optimal stable matching

regardless of the order in which the proposers are selected

Proof

- Let S be the output of GS and S^* be the man-optimal stable matching
- Suppose to the contrary that $S \neq S^*$, i.e., $\exists m$ was rejected by $S^*(m)$
- Let m' be the partner of $w := S^*(m)$ at the first such rejection
- Then $m' \succ_w m$ and $w \succ_{m'} w' \rightarrow (m', w)$ blocks S^*
 \rightarrow contradiction

Exercise

Find all the stable matchings
